

CIS 426: ENTERPRISE ARCHITECTURE ASSIGNMENT

Q3:

Previously, the state university increased the registration process in order to increase the number of students on campus and cut administrative costs. While the data is entered manually, the cost of the campus revenue rises. While manually entering data, a duplicate issue with login credentials arises. In each step, the university opted to unite the core campus with the UAE campus and provide more services. The previous state is when IT services are implemented to minimise costs and boost system flexibility. The data is organised as a result of the installation of these services, and there is a very low risk of data loss. The manual process in the after state can result in the loss of numerous student records.
